USE ONLY FOR FILING A PROVISIONAL APPLICATION FOR PATENT

This collection of information is required by 37 CFR 1.51. The information is used by the public to file (and by the PTO to process) a provisional application. Confidentiality is governed by 35 U.S.C. 122 and 37 CFR 1.14. This collection is estimated to take 8 hours to complete, including gathering, preparing, and submitting the complete provisional application to the PTO. Time will vary depending upon the individual case. Any comments on the amount of time you require to complete this form and/or suggestions for reducing this burden, should be sent to the Chief Information Officer, U.S. Patent and Trademark Office, U.S. Department of Commerce, P.O. Box 1450, Alexandria, VA 22313-1450. DO NOT SEND FEES OR COMPLETED FORMS TO THIS ADDRESS. SEND TO: Mail Stop Provisional Application, Commissioner for Patents, P.O. Box 1450, Alexandria, VA 22313-1450.

CONDOM WITH WARMTH IMPARTING LUBRICANT

Field of the Invention

The field of the present invention relates generally to condoms, and more specifically to condoms having a lubricant system which imparts warmth, or provides a warming effect or sensation upon use.

Background of the Invention

A variety of lubrication systems for condoms are disclosed in the art. Some of the lubricants employed are sold or supplied separately as so-called personal lubricants, while others are applied to condoms prior to packaging. Some lubricants have particular physiological effects. For example, Heidenfelder (U.S. Patent No. 4,840,188) discloses the coating of the interior surface of a condom with a local anesthetic such as benzocaine to provide desensitization.

The instant invention is directed to a condom together with a lubricant which provides a warming effect or sensation upon use. This effect is in contrast to the cooling sensation imparted by conventional lubricants.

Summary of the Invention

The present invention generally provides a condom in combination with a lubricant composition comprising one or more glycols. Such glycols, provided they are present in an environment relatively free from unbound water, will warm upon contact

with compositions containing unbound water. Such warming of glycol based condom lubricants results in a warming sensation during condom use.

In one aspect of the present invention there is provided a condom comprising:

A male genital engaging tubular sheath having an inner surface and an outer surface together with a lubricant composition comprising one or more glycols in a mixture containing little or no unbound water, such that said lubricating composition warms upon contact with compositions containing free or unbound water.

Detailed Description of the Invention

In one embodiment of the present invention, either the interior surface, the exterior surface, or both the interior and exterior surfaces are lubricated with a lubricant composition comprising one or more glycols in combination with a conventional lubricating gel. For example, propylene glycol and polyethylene glycol may be combined with a conventional lubricating gel such as the glyceryl polymethaylate based products sold by Guardian under the trademark Lubrajel CG. Optionally, glycerin (glycerol) may be added. This mixture will contain minimum amounts of water, as the Lubrajel CG has some water present. However, for example, the 24%-34% water found in Lubrajel CG is generally present in a bound form. Accordingly, the described lubricating composition contains relatively little free or unbound water. As a result, when this lubricating composition comes into contact with free water, as may be found in the bodily secretions which contact condoms during use, the glycerols react exothermically with the free water, resulting in an increase in lubricant temperature, and the imparting of a sense of warmth to the condom users. This is in contrast to

conventional condom lubricating systems which typically impart a cooling sensation to the users.

Although conventional personal lubricants have in the past utilized glycols as an ingredient, free water generally has heretofore been utilized as a solvent. In such prior art compositions wherein free water has been present, as for example as a solvent, the presence of the free or unbound water in the glycol-containing lubricant compositions acts to minimize any noticeable heat of reaction upon contact of the lubricant with further water. Accordingly, the glycol containing lubricants found in the prior art imparted a cooling sensation to users. This is in marked contrast to the warming sensation imparted by the lubricating composition of the present invention, which contains glycols within a lubricant composition containing only minimal amounts of free water. There are examples in the art of lubricants which make use of the heat generated by the reaction of water and polyhydric alcohols. See US 2003/0211161 A1. Note, however, that application is not directed to the use of heating lubricants in connection with packaged condoms.

Example 1

Preparation of a Lubricant Composition

A lubricant composition in accordance with the present invention having the formula shown in Table 1 was prepared as follows:

Table 1

Ingredient	Percent w/w
Propylene Glycol	20.0% w/w.
Polyethylene Glycol 400	45.0 % w/w.
Lubrajel® CG*	25.0% w/w.
Glycerin 96%	10.0% w/w.
	100.0%

*Lubrajel® is a registered trademark of Guardian Chemical Corporation, Hauppauge, New York and contains glyceryl polymethacrylate, propylene glycol and water, the water being present in an amount of between about 24% to 34%, and said water being generally in a bound state, unable to undergo substantial reaction with the glycols present.

The lubricant described in Table 1 may be applied to a condom in a conventional fashion, wherein a portion of lubricant is shot into the interior of the condom and a portion of the lubricant is placed on the exterior. The so-coated condom may then be foil-wrapped using procedures common to the art. For coating purposes, it is preferred that 0.45g to 0.75 g. of lubricant be applied to the exterior surface of the condom and 0.15g to 0.45g of the lubricant be applied to the interior surface. A typical method of applying lubricant to condom surfaces, such as is described in pending United States Patent Application 2002/0103414 A1 (which application is incorporated herein by reference), may be utilized in connection with the instant invention for application of the lubricant to the condom surfaces.

To demonstrate the temperature raising ability of the condom lubricant prepared in Example 1, a measurement was made of the temperature increase which took place when one (1) gram of the lubricant was mixed with one (1) gram of water. To measure

this temperature increase, a sensitive thermocouple thermometer was affixed to the surface of a laboratory hotplate. The thermometer was set to record the temperature changes at a rate of one point per second for a 300 second (5 minute) time period. The hotplate was warmed to body temperature, approximately 98.6°F, to simulate in-use conditions. To further simulate in-use conditions, warm water, also approximately 98.6°F, was used to represent vaginal fluids. The thermometer recording was started, and after 15 seconds, 1 gram of the warm water was applied to the thermocouple.

A 4.0°F drop in temperature followed the initial application of the warm water to the hotplate. Although both the hotplate and the water were at approximately the same temperature (98.6), the drop in temperature upon addition of water to the hot plate was related to the equipment set-up and the test being performed in the open-air, which permitted evaporative cooling to occur.

The water on the hotplate was then allowed to come into temperature equilibrium with the hotplate, and the temperature soon stabilized at about 94.0°F. At that point the lubricant (1 gram) was added to the water on the hotplate. The lubricant was at an ambient temperature (71°F), which was chosen as being representative of lubricant temperature in a typical situation prior to use. This ambient temperature lubricant was mixed into the water. At that point there was a drop in temperature of 9.2°F. This drop was expected as the warm water had to equilibrate with the cooler lubricant. Over the next twenty (20) seconds, however, the lubricant/water mixture spontaneously heated to a temperature of 99.1°F, an increase of 14.3°F from the lowest equilibrium temperature of the lubricant/water mixture, and 5.1°F warmer than the temperature of the water before any lubricant was added.

This clearly demonstrated the heat producing property of the lubricant, which underwent an exothermic reaction, releasing a heat of solution as it dissolved in free water.

Although various embodiments of the invention have been shown and described, they are not intended to limit the invention as encompassed by the claims forming part of the application. Those of skill in the art may recognize certain modifications to these embodiments, which modifications are meant to be covered by the appended claims.

What Is Claimed Is:

1. A packaged condom comprising:

a male genital engaging tubular sheath having an inner surface and an outer surface together with a lubricating composition comprising one or more glycols located on at least a portion of the tubular sheath, such that said lubricating composition warms upon contact with compositions containing free water.
2. The condom of claim 1, wherein the lubricating composition is present on both the inner and outside surface of the sheath.
3. The condom of claim 1, wherein the lubricating composition comprises at least about 10% propylene glycol.
4. The condom of claim 1, wherein the lubricating composition comprises at least about 30% polyethylene glycol.
5. The condom of claim 1 wherein the lubricating composition comprises at least about 10% propylene glycol and at least about 30% polyethelyne glycol.
6. The condom of claim 5, wherein the lubricating composition further comprises glyceryl polymethacrylate.

7. The condom of Claim 6, wherein said lubricating composition further includes at least about 5% glycerin.

8. The condom of claim 1, wherein the lubricating composition has the following formula:

Propylene Glycol	20% w/w;
Polyethylene Glycol	45% w/w;
Mixture of Glyceryl	
Polymethacrylate, Propylene	
Glycol and Water	25% w/w; and
Glycerin 96%	10%

9. The condom of Claim 8, wherein said condom has an exterior surface and an interior surface and wherein 0.45g to 0.75g of the lubricating composition is applied to the exterior surface and 0.15g to 0.45g of the lubricating composition is applied to the interior surface, and wherein the condom is then foil-wrapped.

Abstract of the Disclosure

A condom together with a lubrication composition, the lubricating composition containing a minimal amount of free water, and comprising one or more glycols, such that the glycols in the lubricant release heat and warmth when contacted with compositions containing free water.
